CC -!- FUNCTION: TRANSFER OF ELECTRON SERON WADH TO THE RESPIRATORY COMPLEX I SELECTRON ACCEPTOR FOR THE ENZYME IS BELIEVED TO BE UBIQUINONE. COMPONENT OF THE FLAVOPROTEIN-SULFUR (FP)

CC -!- CATALYTIC ACTIVITY: NADH + UBIQUINONE - NAD(+) + UBIQUINOL.

CC -!- CATALYTIC ACTIVITY: NADH + UBIQUINONE - NAD(+) + UBIQUINOL.

CC -!- CATALYTIC ACTIVITY: NADH + UBIQUINONE - NAD(+) + UBIQUINOL.

CC -!- CATALYTIC ACTIVITY: NADH + UBIQUINONE - NAD(+) + UBIQUINOL.

CC -!- SUBUNIT: COMPLEX I IS COMPOSED OF ABOUT 40 DIFFERENT SUBUNITS.

CC -!- SUBUNIT: COMPONENT OF THE FLAVOPROTEIN FRACTION.

CC -!- SUBUNIT: SIS A COMPONENT OF THE FLAVOPROTEIN FRACTION.

CC -!- SIMILARITY: BELONGS TO THE COMPLEX I 24 KD SUBUNIT FAMILY.

CC -!- SIMILARITY: BELONGS TO THE COMPLEX I 14 KD SUBUNIT FAMILY.

CC -!- SIMILARITY: BELONGS TO THE COMPLEX I 14 KD SUBUNIT FAMILY.

1 FUNCTION: TARANSFER OF ELECTRON FROM NADH TO THE RESPIRATORY
CHAIN. THE IMMEDIATE ELECTRON SFROM NADH TO THE ENZYME IS BELLEVED
TO BE UBIQUILMONE. DOSES COUPLE THE REBOX REACTION TO PROTON
TRANSLOCATION AND THUS CONSERVES THE REDOX ENERGY IN A PROTON

TRANSLOCATION AND THUS CONSERVES THE REDOX ENERGY IN A PROTON
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SEQUENCE FROM N.A.

VIDEIRA A., TROPSCHUG M., WERNER S.;

VIDEIRA A., TROPSCHUG M., VITO expression and import into mitochondria primary structure, in vitro expression and import into mitochondria of a 29/21-kDa subunit of complex I from Neurospora crassa.";

Blochem. Biophys. Res. Commun. 166:280-285(1990).

IF FUNCTION: TRANSFER OF ELECTRONS FROM NADH TO THE RESPIRATORY CHAIN. THE IMMEDIATE ELECTRON ACCEPTOR FOR THE ENZYME IS BELIEVED TO BE UBIQUINONE.

TO BE UBIQUINONE.

IF SUBUNIT: COMPLEX I IS COMPOSED OF ABOUT 30 DIFFERENT SUBUNITS.

SUBCELLULAR LOCATION: MITOCHONDRIAL INNER MEMBRANE. IMPORTATION INTO MITOCHONDRION IS MEMBRANE POTENTIAL DEPENDENT.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This SWISS-PROT entry is copyright. "Opsin of Calliphora peripheral photoreceptors R1-6. Homology with

"Opsin of Calliphora peripheral processing.";

J. Biol. Chem. 265:17906-17910(1990).

-i- FUNCTION: VISUAL PICKENTS ARE THE LIGHT-ABSORBING MOLECULES THA

MEDIATE VISION. THEY CONSIST OF AN APPOPROTEIN, OPSIN, COVALENTI

LINKED TO CIS-RETINAL.

-i- SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN.

-i- FIM: SOME OR ALL OF THE CARBOXYL-TERMINAL SER OR THR RESIDUES M

BE PHOSPHORYLATED.

-I- MISCELLANEOUS: EACH EYE IS COMPOSED OF 800 FACETS OR OMMATIDIA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        U1-AUG-1991 (Rel. 19, Created)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          MISCELLANEOUS: EACH EYE IS COMPOSED OF 800 FACETS OR OMMATIDIA. EACH OMMATIDIM CONTAINS 8 PHOTORECEPTOR CELLS (R1-R8), THE R1 R6 CELLS ARE OUTER CELLS, WHILE R7 AND R8 ARE INNER CELLS. MISCELLANEOUS: OPSIN RH1 HAS AN ABSORPTION MAXIMA AT 480 NM. SIMILARITY: BELONGS TO FAMILY 1 OF G-PROTEIN COUPLED RECEPTORS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             OPSIN SUBFAMILY.

LINKED TO CIS-RETINAL.

SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN.

PTM: SOME OR ALL OF THE CARBOXYL-TERMINAL SER OR THR RESIDUES MAY
BE PHOSPHORYLATED.

BE PHOSPHORYLATED.

MISCELLANEOUS: EACH DROSOPHILA EYE IS COMPOSED OF 800 FACETS OR
OMAGATIDIA. EACH OWMATIDIM CONTAINS 8 PHOTORECEPTOR CELLS (R1-R8)

THE R1 TO R6 CELLS ARE OUTER CELLS, WHILE R7 AND R8 ARE INNER
CELLS.

MISCELLANEOUS: OPSIN RH1 HAS AN ABSORPTION MAXIMA AT 480 NM.

SIMILARITY: BELONGS TO FAMILY 1 OF G-PROTEIN COUPLED RECEPTORS.
                                                                                                                                                                                                                                                                                                                                                                                                          KVDDGKSSDA
